MEMORANDUM OF UNDERSTANDING
FOR THE 2011 – 2012 NEUTRINO PROGRAM

T-1020

NaI Crystal Test for DM-Ice

October ~~17~~18, 2011

TABLE OF CONTENTS

MOU for NaI Crystal Test for DM-Ice

INTRODUCTION

This is a memorandum of understanding between the Fermi National Accelerator Laboratory (Fermilab) and the experimenters of the NaI Crystal Test for DM-Ice from the University of Wisconsin who have committed to participate in beam tests to be carried out during the 2011 – 2012 Fermilab Neutrino program.

The memorandum is intended primarily for the purpose of recording expectations for budget estimates and work allocations for Fermilab, the funding agencies and the participating institutions. It reflects an arrangement that currently is satisfactory to the parties; however, it is recognized and anticipated that changing circumstances of the evolving research program will necessitate revisions. The parties agree to modify this memorandum to reflect such required adjustments. Actual contractual obligations will be set forth in separate documents.

Description of Detector and Tests:

The DM-Ice collaboration is designing a sodium-iodide (NaI) based detector for a direct dark matter search. The detectors should have low readout noise and background levels to carry out a sensitive search. A 17-kg version of the experiment is running at the South Pole, 2500 m deep in the Antarctic ice, and a larger scale experiment is currently being designed. One of the keys to the success of the experiment is to have a good understanding of the background levels intrinsic in the NaI detectors.

To measure the background level, the detectors have to be shielded against cosmic rays. The lead shielding used for DAMIC (see T-987) in the MINOS Underground Areas is a well-suited location for this test since it offers enough overburden to shield against cosmic rays, lead shielding, and experimental infrastructure.

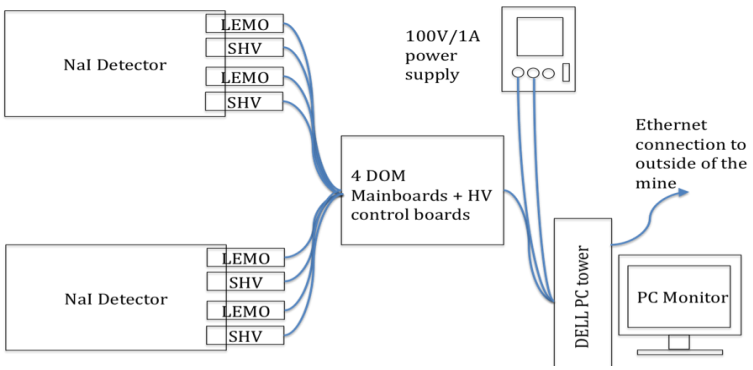

Figure 1.: A schematic of the data acquisition for the DM-Ice NaI test

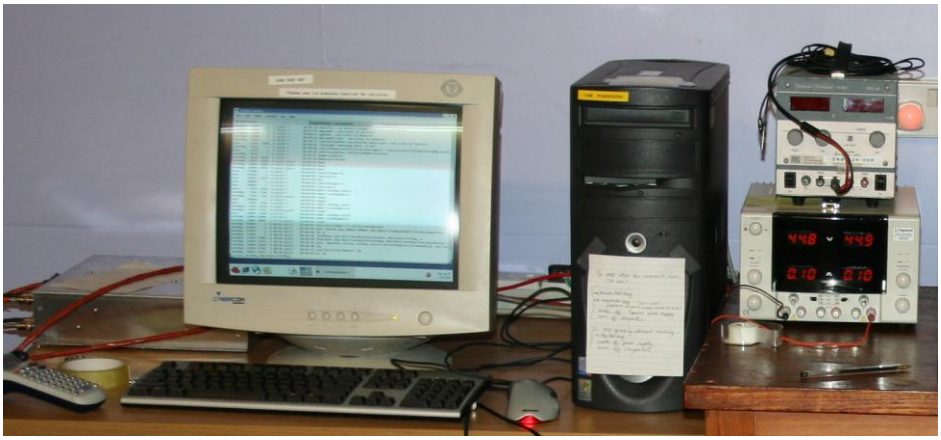

Figure 2: From left: electronics chassis containing the HV generator and pulse shape digitization board, a PC monitor and tower, and two power supplies. Only the bottom power supply will be used in this experiment.

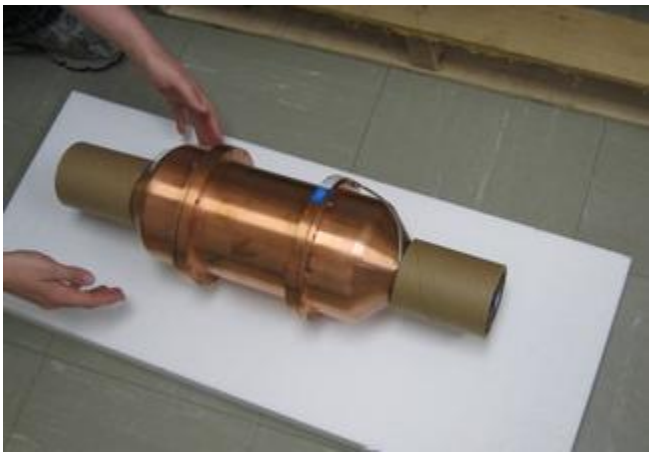

Figure 3: NaI(Tl) detector to be tested consisting of two PMTs placed on either ends. This detector along with PMT bases will be placed inside the lead shielding.

The goal of the test is to assess the background levels in the detector and to assess the characteristics of phosphorescence induced by muons and 100 keV - 3 MeV gamma rays.

MOU for NaI Crystal Test for DM-Ice

I. PERSONNEL AND INSTITUTIONS:

Spokesperson: Reina Maruyama

Physicist in charge of beam tests: Walter Pettus

Fermilab liaison: Aria Soha

The group members at present are:

	Institution	Collaborator	Country	Rank/Position	Other Commitments
1.1	University of Wisconsin, Madison	Reina Maruyama	USA	Assistant Professor	IceCube, CUORE
		Karsten Heeger	USA	Associate Professor	Daya Bay, CUORE
		Walter Pettus	USA	Graduate Student	
		Benjamin Broerman	USA	Undergraduate	
		Chris Hilgenberg	USA	Undergraduate	
		David Webber	USA	Postdoc	Daya Bay

II. EXPERIMENTAL AREA, BEAMS AND SCHEDULE CONSIDERATIONS:

2.1 LOCATION

2.1.1 The apparatus for the beam test(s) will be located in the MINOS Underground Area. ~~There is a large area immediately upstream from the MINOS near detector. This area~~The Detector Hall Access Tunnel has been recently used for the DAMIC experiment, and the experimenters request the use of their lead shielding for this test. Much of this area is well off the beam axis and would be ideal for the DM-Ice test. The experimental apparatus plus shielding will occupy a footprint roughly eight feet square. The apparatus requires standard 110 VAC lines for the electronics.

2.2 BEAM

2.2.1 BEAM TYPES AND INTENSITIES

This test does not utilize any particle beams. The initial tests can be done when the beam is on. H~~h~~owever the experiment should operate when the beam to the hall is off to minimize backgrounds.

2.3 EXPERIMENTAL CONDITIONS

2.3.1 AREA INFRASTRUCTURE

Location of the experiment, underground, is depicted in Appendix I. Only the NaI(Tl) detector (see Fig. 3) and PMT voltage dividers will be placed inside the lead shielding. The electronics (Fig. 2) will be placed just outside. If possible, the PC tower shown should have Ethernet access to allow for remote operation and monitoring.

The NaI detector and data acquisition system are all light enough to be handled by a single person, though a cart to transport the equipment will be helpful.

Standard 110 VAC lines for the electronics are required, as well as one Ethernet connection. A second Ethernet connection is useful, though not absolutely necessary. The Ethernet connection to the data acquisition system will be used to remotely control and monitor the detector. It will also be used to transfer the data to servers at the University of Wisconsin.

The experiment acknowledges that due to the nature of the underground environment, ground water seeps from the ceiling and walls and pools on the floor, and will take measures to protect their equipment as they see fit, while abiding by fire hazard codes.

2.3.2 DESCRIPTION OF TESTS

After the initial setup and commissioning, the detector will be operated remotely via the Ethernet connection and data will be taken continuously, with an occasional interruption for detector calibration with gamma sources. The background levels ~~of~~ at the detector and the system will be assessed, along with possible phosphorescence induced by muons and 100 keV - 3 MeV gamma rays. The detector and data acquisition setup are shown in Figs. 1 – 3.

2.4 SCHEDULE

The DM-Ice NaI crystal test is ready for immediate setup and installation. We expect it will take 2-3 days to setup and start the test. The experimenters expect to be able to start the tests upon approval, in late October or November 2011. After the installation is complete the experimenters will collect data continuously for ~1 month with occasional short calibrations. During data taking the experimenters will look at the results and decide on the next steps for this project.

The experimenters acknowledge that the apparatus will have to be removed by March 1, 2012 for the duration of the 2012–2013 Fermilab shutdown, and beam after the shutdown will need to be renegotiated.

Comment [RM1]: Let me know if this is unacceptable. I lifted verbiage directly from the DAMIC MOU.

Comment [RM2]: Is this necessary?

Comment [Aria3]: Yes, All equipment must be removed from this passageway before the construction of the Nova cavern. (Whatever remains will be run over with a wolverine)

III. RESPONSIBILITIES BY INSTITUTION – NON FERMILAB

3.1 UNIVERSITY OF WISCONSIN:

- The University of Wisconsin will be responsible for supplying the detector and data acquisition electronics as well as the personnel to run the detector. The equipment supplied are:
    - NaI(Tl) detector, each equipped with two photomultiplier tubes and bases. (qty: 2)
    - 2 electronics chassis containing 2 DOM mainboards and HV control boards. (2 BNC output, 2 SHV output, 1 input from PC) (qty 2)
    - 4 BNC – LEMO adaptors
    - 1 Tower PC equipped with one IceCube "dor" data acquisition card
    - PC monitor, keyboard, and mouse
    - 1 power supply (120V/1A)
    - 4 SHV cables
    - 4 LEMO or BNC cables
    - Connector/cable between power supply and dor card
    - Connector/cable between dor card and chassis to mainboards
    - 1 Ethernet cable

Total existing items: $15k

IV. RESPONSIBILITIES BY INSTITUTION – FERMILAB

4.1 FERMILAB ACCELERATOR DIVISION:

No accelerator division support is required.

4.2 FERMILAB PARTICLE PHYSICS DIVISION:

4.2.1 The test-beam efforts in this MOU will make use of the MINOS Underground Areas as outlined in Section II. The Fermilab Particle Physics Division will be responsible for coordinating overall activities in the MINOS Underground Area. [2 person-weeks]

4.2.2 Technical support to assist in moving the experimental equipment into and out of the MINOS Underground Area and moving the lead shielding [0.4 person-weeks]

4.2.3 A person appropriately trained to handle sealed-sources for occasional detector calibration. [0.8 person-weeks]

4.2.4 Conduct a NEPA review of the experiment.

4.2.5 Provide day-to-day ES&H support/oversight/review of work and documents as necessary.

4.2.6 Provide safety training as necessary, with assistance from the ES&H Section.

4.2.7 Update/create ITNA's for users on the experiment.

~~4.2.3~~4.2.8 Coordinate the ES&H Operational Readiness Clearence Review or other required safety reviews. [0.2 person-weeks]

Comment [RM4]: Lauren Hsu (Fermilab Center for Particle Astrophysics) has agreed to serve as the on-site calibration source handler.

Comment [Aria5R4]: Ewa Skup (PPD) will fill this role

4.3 FERMILAB COMPUTING ~~SECTION~~SECTOR

4.3.1 Internet access underground/on surface.

4.4 FERMILAB ES&H SECTION

4.4.1 Assistance with safety reviews.

4.4.2 Loan of radioactive sources, Co-57, Co-60, and Cs-137 for 1 hour calibration runs scattered throughout the duration of the experiment.

4.4.3 Provide ~~necessary~~ safety training, with assistance from PPD, as necessary ~~training~~ for experimenters.

V. SUMMARY OF COSTS

Source of Funds [$K]	Materials & Services	Labor (person-weeks)
Particle Physics Division	0.0	3.42
Accelerator Division	0	0
Computing ~~Section~~Sector	0	0
ES&H Section	0	0
Totals Fermilab	$0.0K	3.42
Totals Non-Fermilab	$15k	4

VI. ~~SPECIAL~~ GENERAL CONSIDERATIONS

6.1 The responsibilities of the Spokesperson and the procedures to be followed by experimenters are found in the Fermilab publication ~~"~~"Procedures for Researchers~~"~~": (http://www.fnal.gov/directorate/PFX/PFX.pdf). The Spokesperson agrees to those responsibilities and to ensure that the experimenters all follow the described procedures.

6.2 To carry out the experiment a number of Environmental, Safety and Health (ES&H) reviews are necessary. This includes creating an Operational Readiness Clearance document in conjunction with the standing Particle Physics Division committee. The Spokesperson will follow those procedures in a timely manner, as well as any other requirements put forth by the Division's Safety Officer.

6.3 The Spokesperson will ensure one person is on-call and available by phone at all times whenever the detector is being operated and that this person is knowledgeable about the experiment's hazards.

6.4 All regulations concerning radioactive sources will be followed. No radioactive sources will be carried onto the site or moved without the approval of the Fermilab ES&H section.

6.5 All items in the Fermilab Policy on Computing will be followed by the experimenters. (http://computing.fnal.gov/cd/policy/cpolicy.pdf).

6.6 The Spokesperson will undertake to ensure that no PREP or computing equipment be transferred from the experiment to another use except with the approval of and through the mechanism provided by the Computing ~~Section~~Sector management. The Spokesperson also undertakes to ensure no modifications of PREP equipment take place without the knowledge and written consent of the Computing ~~Section~~Sector management.

6.7 The experimenters will be responsible for maintaining both the electronics and the computing hardware supplied by them for the experiment. Fermilab will be responsible for repair and maintenance of the Fermilab-supplied electronics. Any items for which the experiment requests that Fermilab performs maintenance and repair should appear explicitly in this agreement.

At the completion of the experiment:

6.8 The Spokesperson is responsible for the return of all PREP equipment, computing equipment and non-PREP data acquisition electronics. If the return is not completed after a period of one year after the end of running the Spokesperson will be required to furnish, in writing, an explanation for any non-return.

6.9 The experimenters agree to remove their experimental equipment as the Laboratory requests them to. They agree to remove it expeditiously and in compliance with all ES&H requirements, including those related to transportation. All the expenses and personnel for the removal will be borne by the experimenters unless removal requires facilities and personnel not able to be supplied by them, such a rigging, crane operation, etc.

6.10 The experimenters will assist Fermilab with the disposition of any articles left in the offices they occupied.

6.11 An experimenter will be available to report on the test beam effort at a Fermilab All Experimenters' Meeting.

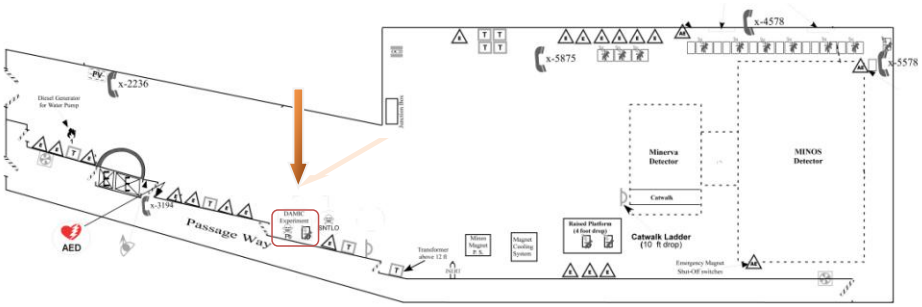
APPENDIX I: MT6 AREA LAYOUT

The test will utilize the lead shielding used for the DAMIC experiment. A table next to the shielding for the power supply, data acquisition electronics, and computer is requested.



APPENDIX II: - HAZARD IDENTIFICATION CHECKLIST

Items for which there is anticipated need have been checked. See next page for detailed descriptions of categories.

Flammable Gases or Liquids		**Other Gas Emissions**		**Hazardous Chemicals**		**Other Hazardous /Toxic Materials**
Type:		Type:			Cyanide plating materials	List hazardous/toxic materials planned for use in a beam line or an experimental enclosure:
Flow rate:		Flow rate:			Hydrofluoric Acid	
Capacity:		Capacity:			Methane	
Radioactive Sources		**Target Materials**			photographic developers	
	Permanent Installation		Beryllium (Be)		PolyChlorinatedBiphenyls	
X	Temporary Use		Lithium (Li)		Scintillation Oil	
Type:	Co-57, Co-60, Cs-137		Mercury (Hg)		TEA	
Strength:	0.1 microCi		Lead (Pb)		TMAE	
Lasers			Tungsten (W)		Other: Activated Water?	
	Permanent installation		Uranium (U)			
	Temporary installation		Other:	**Nuclear Materials**		
	Calibration	**Electrical Equipment**		Name:		
	Alignment		Cryo/Electrical devices	Weight:		
Type:			Capacitor Banks	**Mechanical Structures**		
Wattage:			High Voltage (50V)		Lifting Devices	
MFR Class:			Exposed Equipment over 50 V		Motion Controllers	
			Non-commercial/Non-PREP		Scaffolding/ Elevated Platforms	
			Modified Commercial/PREP		Other:	
Vacuum Vessels		**Pressure Vessels**		**Cryogenics**		
Inside Diameter:		Inside Diameter:			Beam line magnets	
Operating Pressure:		Operating Pressure:			Analysis magnets	
Window Material:		Window Material:			Target	
Window Thickness:		Window Thickness:			Bubble chamber	

Comment [RM6]: Flexible here. We don't need a strong source and we should adjust this according to safety regulations.

OTHER GAS EMISSION

Greenhouse Gasses (Need to be tracked and reported to DOE)

- ❑ Carbon Dioxide, including CO_2 mixes such as Ar/CO_2
- ❑ Methane
- ❑ Nitrous Oxide
- ❑ Sulfur Hexafluoride
- ❑ Hydro fluorocarbons
- ❑ Per fluorocarbons
- ❑ Nitrogen Trifluoride

NUCLEAR MATERIALS

Reportable Elements and Isotopes / Weight Units / Rounding

Name of Material	MT Code	Reporting Weight Unit Report to Nearest Whole Unit	Element Weight	Isotope Weight	Isotope Weight %
Depleted Uranium	10	Whole Kg	Total U	U-235	U-235
Enriched Uranium	20	Whole Gm	Total U	U-235	U-235
Plutonium-242[1]	40	Whole Gm	Total Pu	Pu-242	Pu-242
Americium-241[2]	44	Whole Gm	Total Am	Am-241	–
Americium-243[2]	45	Whole Gm	Total Am	Am-243	–
Curium	46	Whole Gm	Total Cm	Cm-246	–
Californium	48	Whole Microgram	–	Cf-252	–
Plutonium	50	Whole Gm	Total Pu	Pu-239+Pu-241	Pu-240
Enriched Lithium	60	Whole Kg	Total Li	Li-6	Li-6
Uranium-233	70	Whole Gm	Total U	U-233	U-232 (ppm)
Normal Uranium	81	Whole Kg	Total U	–	–
Neptunium-237	82	Whole Gm	Total Np	–	–
Plutonium-238[3]	83	Gm to tenth	Total Pu	Pu-238	Pu-238
Deuterium[4]	86	Kg to tenth	D_2O	D_2	
Tritium[5]	87	Gm to hundredth	Total H-3	–	–
Thorium	88	Whole Kg	Total Th	–	–
Uranium in Cascades[6]	89	Whole Gm	Total U	U-235	U-235

[1] Report as Pu-242 if the contained Pu-242 is 20 percent or greater of total plutonium by weight; otherwise, report as Pu 239-241.

[2] Americium and Neptunium-237 contained in plutonium as part of the natural in-growth process are not required to be accounted for or reported until separated from the plutonium.

[3] Report as Pu-238 if the contained Pu-238 is 10 percent or greater of total plutonium by weight; otherwise, report as plutonium Pu 239-241.

[4] For deuterium in the form of heavy water, both the element and isotope weight fields should be used; otherwise, report isotope weight only.

[5] Tritium contained in water (H2O or D2O) used as a moderator in a nuclear reactor is not an accountable material.

[6] Uranium in cascades is treated as enriched uranium and should be reported as material type 89.
